

InterX™ therapy

Safe, effective and remarkable results

The treatment

Typically 20-30 minutes, but even 10 minutes could be sufficient to provide a pain relief in the case of acute trauma.

The course of treatment varies from one, up to six. It is important to have treatments close to each other.

- The InterX™ is applied to the skin, typically at the site of pain/inflammation. (It is often applied along the spinal column to stimulate the nerves). The sensation is a comfortable prickle.

- Typically pain lessens immediately after the treatment although there may be some residual pain.

- The full effect from treatment is typically expected next day & may last up to one/two days.

- Often as a result of the stimulation reaching the central nervous system, you may feel sleepy. This allows the body to rest as it promotes the healing process.

Post-treatment

The patient must watch and monitor the changes in their body. These changes are important and help to guide a therapist through the treatment process. After treatment the pain localises in the area where the InterX™ should be applied next and this area can ache at night. This is a common and good reaction and must be reported to the therapist.

You can easily treat yourself at home using a personal version of the InterX

If you can attend your injury as soon as possible, the outcome is extremely effective: you are in a lot less pain throughout the recovery and it heals much faster.

You can use it intensively, up to five times a day in case of a fresh injury or every other day on arthritic pains or back pain. The personal InterX™ can be rented or purchased to support your recovery.

Chronic pain sufferers with nerve related conditions, for example, trigeminal neuralgia, disc diseases, fibromyalgia and others like irritable bowel syndrome, should be treated by a therapist.

Testimonials

'The Interx is the best pain relief I know and I will be eternally grateful that I have it. Thank you again for all you did for me - I am certain that I would not have recovered my mobility to this extent without your treatment.'

P.R. former CRPS sufferer

"I was quite amazed how effective this device is. One or two ten minute sessions on the affected areas and I was ready to do the next training session. I do not confess to understanding how this device works but IT DOES WORK! "

Alan Sutcliffe 'Ironman'
